

Forthcoming Volume - from Oxford University Press

THE DEVELOPMENTAL BIOLOGY OF THE AXOLOTL

John B. Armstrong and George M. Malacinski, Editors

Contents

I. Its scientific and natural history

1. Discovery of the axolotl and its early history as a subject for scientific research - Hobart Smith
2. The natural history of the axolotl and its relationship to other ambystomid salamanders - Ronald Brandon

II. Practical information on working with axolotls
(John Armstrong, Susan Duhon and George Malacinski)

3. Raising the axolotl in captivity
4. Induced spawnings, artificial insemination and other genetic manipulations
5. Diseases
6. Embryonic development: descriptive aspects

III. Model systems

7. Oogenesis - Jean Gautier and Jean-Claude Beetschen
8. Gene expression in early development - Jacques Signoret and Jacques Lefresne
9. Pattern specification in early development - Jonathan Slack
10. Neurulation - Richard Gordon
11. Morphogenetic waves during elongation - John Armstrong
12. Neural crest cell migration - Jan Löffberg
13. Developmental genetics - George Malacinski
14. Cell lethal genes - Anton Neff and George Malacinski
15. Pigmentation and color variants - Sally Frost
16. Organogenesis: the genes *c* and *e* - Robert Cuny and George Malacinski
17. Limb regeneration - Susan Bryant and Ken Muneoka
18. Neurobiology - William Harris and Pat Model
19. Metamorphosis - E.R. Kühn

IV. Appendices

20. Genetic markers and their use in chimeras
21. Cell culture
22. Microsurgery
23. Recipes
24. Axolotls in the wild
25. Directory of axolotl colonies

Anticipated publication is early 1988
